Networking Basics

DE-CIX Academy

01 - Networks, Packets, and Protocols

02 - Ethernet, 02a - VLANs, 02b - QinQ

03 - IP, 03a - Routing, 03b - Global routing

04a - User Datagram Protocol (UDP)

04b - TCP

04c - ICMP + 04d - Traceroute

05 - Uni-, Broad-, Multi-, and Anycast

06a - Domain Name System (DNS)

Internet Model

IP / Internet Layer

- Data units are called "Packets"
- Provides source to destination transport
 - For this we need addresses
- Examples:
 - IPv4
 - IPv6

Layer	Name
5	Application
4	Transport
3	Internet
2	Link
1	Physical

Internet Model

Transport Layer

- *May* provide flow control, reliability, congestion avoidance
- Examples:
 - TCP (flow control, reliability, congestion avoidance)
 - UDP (none of the above)
- Also may contain information about the next layer up

Layer	Name
5	Application
4	Transport
3	Internet
2	Link
1	Physical

Encapsulation

Packets inside packets

- Encapsulation is like Russian dolls
- IP Packets have a payload
- This payload is usually UDP or TCP (there are others as well)
- So we have an UDP packet inside an IP packet

IPv4 Header

"Legacy" IP

- Starts with version and length
- Total length of packet
- Important: Time to live (TTL)
- **Protocol: Type of payload**
 - TCP = 6, UDP = 17
- Source / Destination address 32 bits

Byte	0	1	2	3
0	Version Header Length always 4 5..15	DSCP / ECN	Total Length 20..65535	
4	Identification		Flags / Fragment Offset	
8	Time To Live	Protocol	Header Checksum	
12	Source IPv4 Address			
16	Destination IPv4 Address			
20	Optional (if HeaderLength > 5)			
24				
28				
32				

 Options (optional)

IPv6 Header

Looks simpler, yes?

- Starts with version and some labels
- Payload length in bytes (0-65535)
- **Next Header** - you can chain more headers
 - replaces protocol field, same values
- Hop Limit replaces TTL
- Addresses are now 128bits

Byte	0	1	2	3
0	Version = 6 / Traffic Class / Flow Label			
4	Payload Length in bytes		Next Header	Hop Limit
8	Source IPv6 Address			
12				
16				
20				
24				
28	Destination IPv6 Address			
32				
36				
40				

Next header: Transport layer header

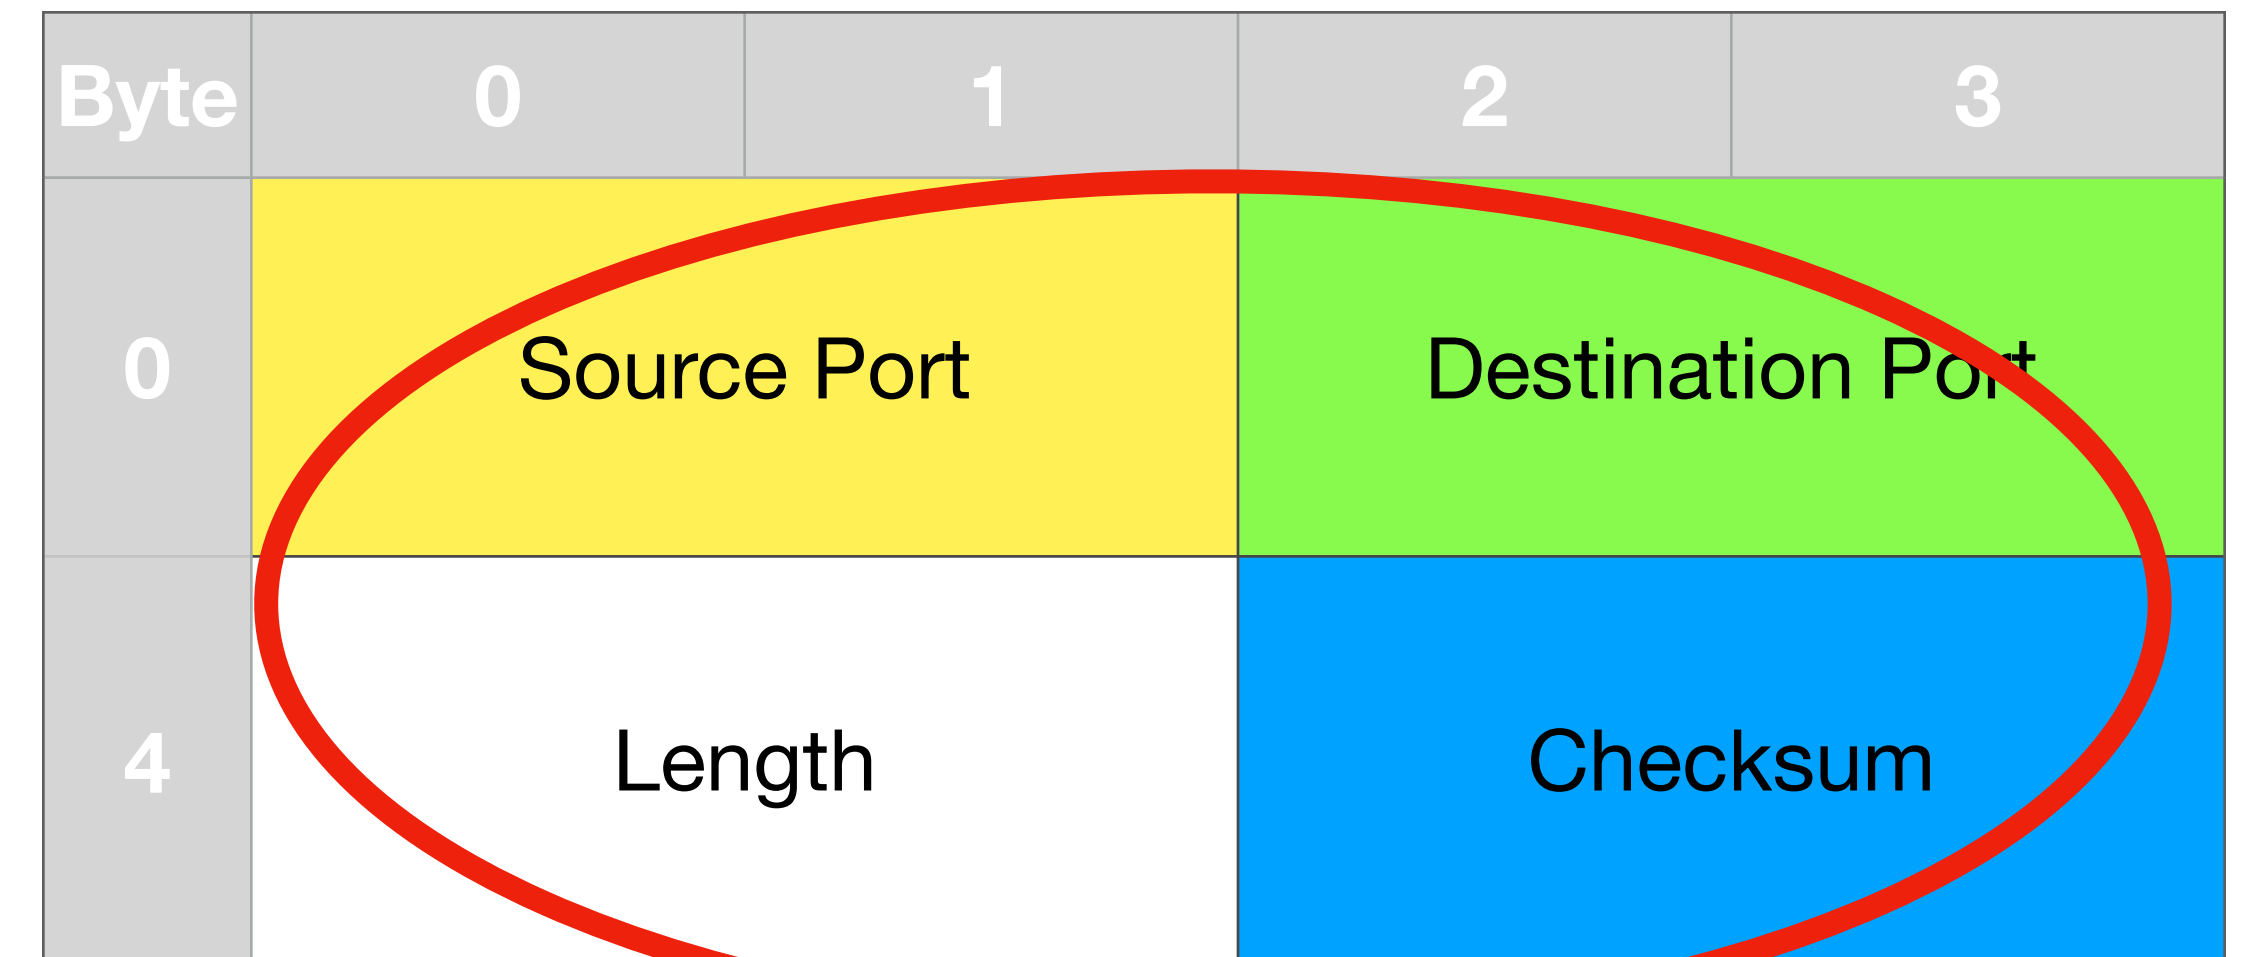

TCP, UDP, and more

- We start with the "easiest" protocol
- UDP
 - User Datagram Protocol
 - Protocol ID is **17**
 - Introduced in 1980
- Lets have a look at the header

Byte	0	1	2	3
0	Version = 6 / Traffic Class / Flow Label			
4	Payload Length in bytes		Next Header	Hop Limit
8	Source IPv6 Address			
12				
16				
20				
24				
28	Destination IPv6 Address			
32				
36				
40				

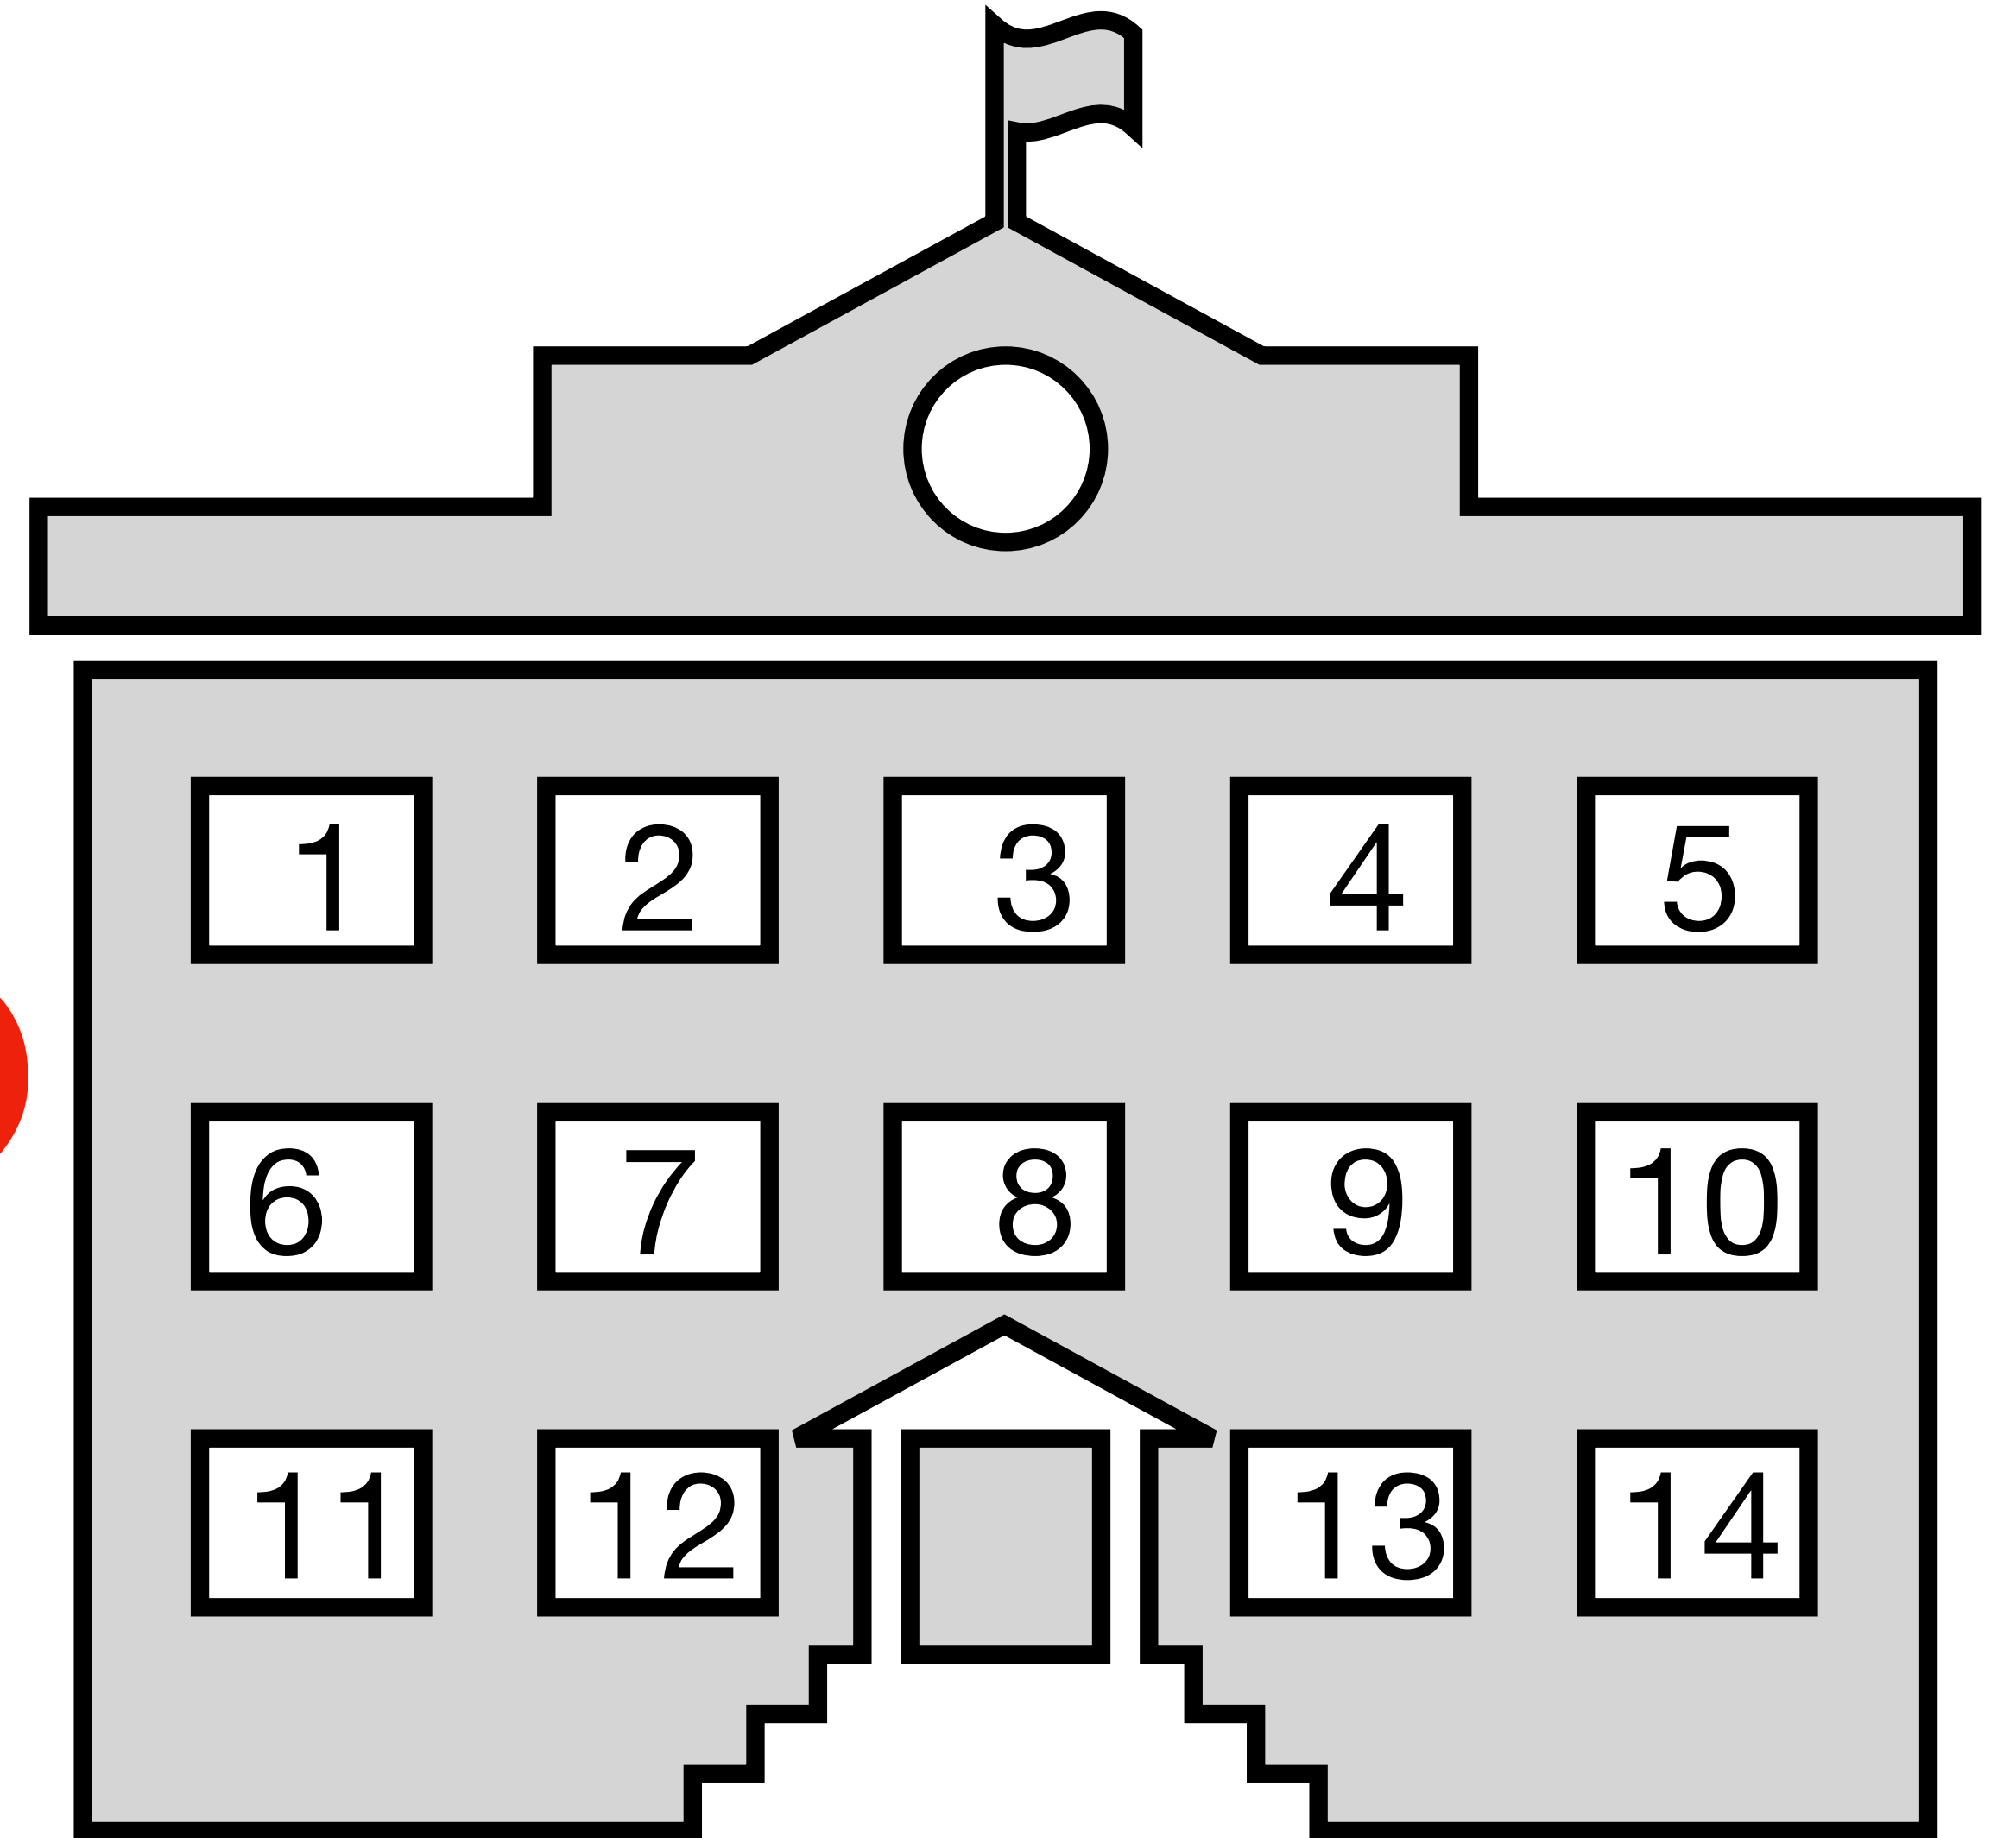

UDP Header

- 4 fields, each of them 16 bits
- Length: UDP header + UDP payload
- Checksum
 - Optional for IPv4, required for IPv6
 - IP header + UDP header are covered
- Source Port
 - Optional, zero if not used
- Destination Port number
 - required

Port number

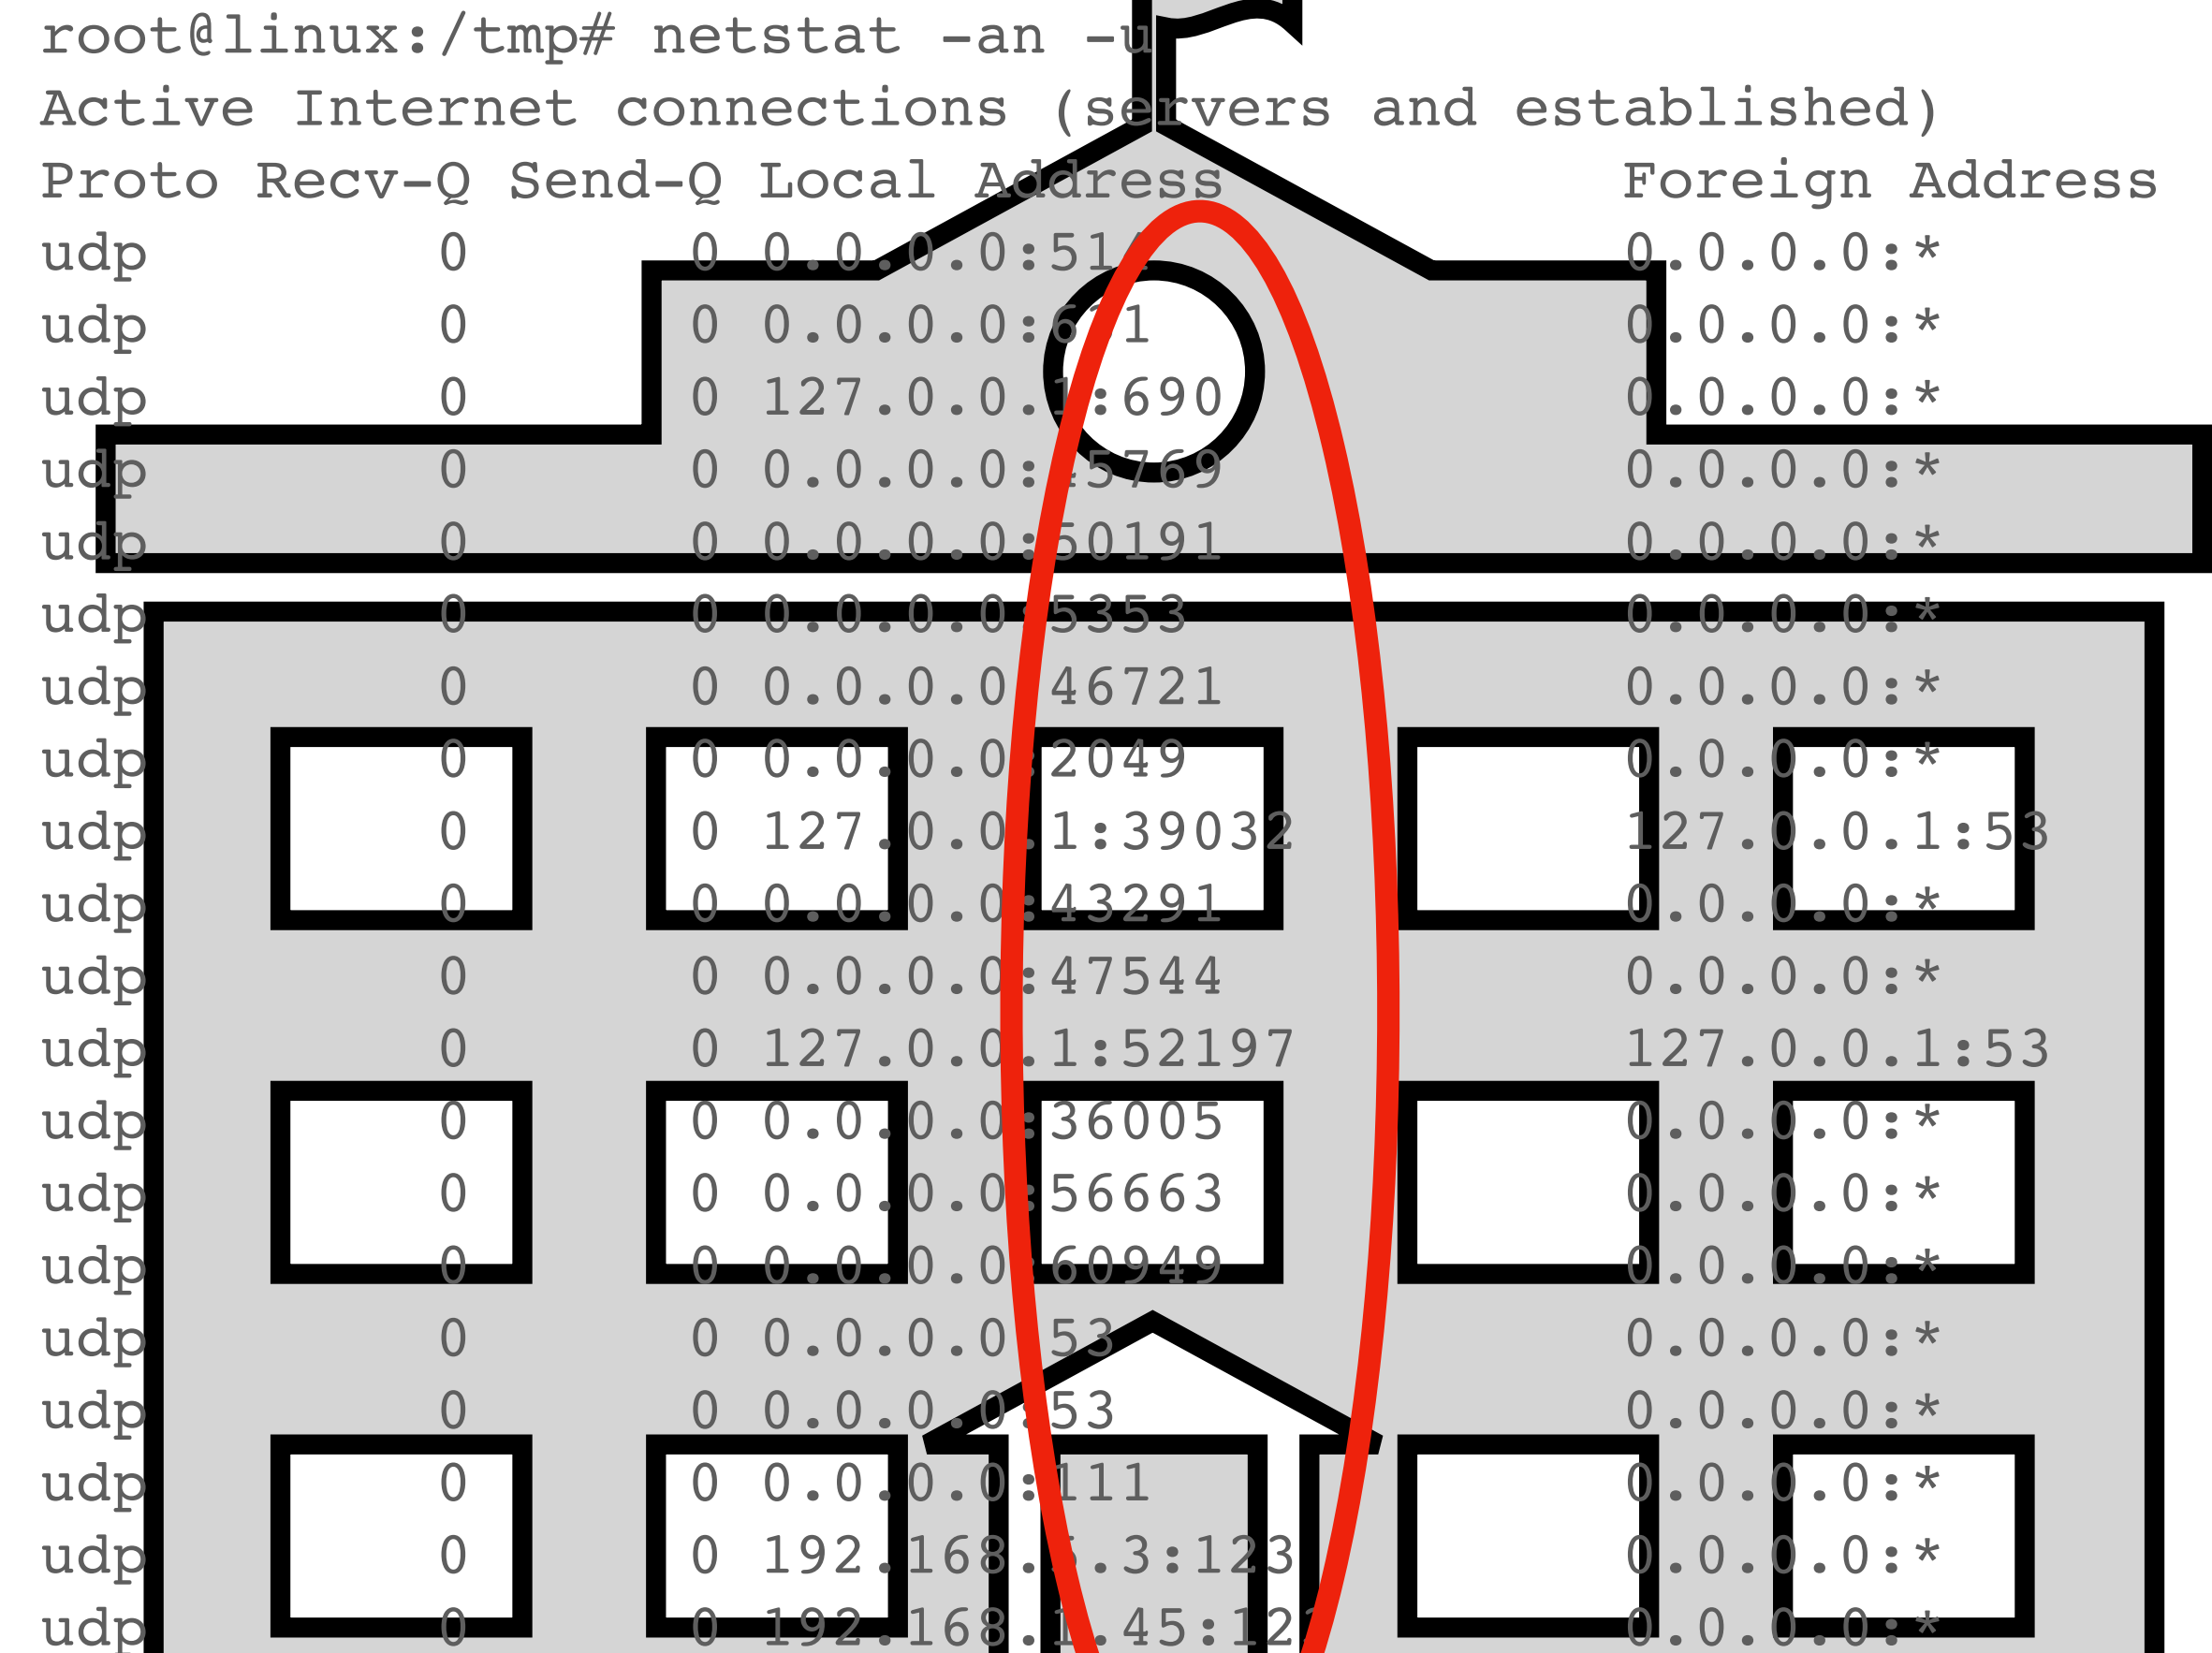

Port number

Port numbers

In reality...

- Of course we have not a building
- We have a computer system
- But we have port numbers
- Behind each port sits a piece of software
 - On some systems this software is called a "daemon"

```
root@linux:/tmp# netstat -an -u
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address Foreign Address
udp 0 0 0.0.0.0:51 0.0.0.0:*
udp 0 0 0.0.0.0:690 0.0.0.0:*
udp 0 0 127.0.0.1:690 0.0.0.0:*
udp 0 0 0.0.0.0:5769 0.0.0.0:*
udp 0 0 0.0.0.0:50191 0.0.0.0:*
udp 0 0 0.0.0.0:5353 0.0.0.0:*
udp 0 0 0.0.0.0:46721 0.0.0.0:*
udp 0 0 0.0.0.0:2049 0.0.0.0:*
udp 0 0 127.0.0.1:39032 127.0.0.1:53
udp 0 0 0.0.0.0:43291 0.0.0.0:*
udp 0 0 0.0.0.0:47544 0.0.0.0:*
udp 0 0 127.0.0.1:52197 127.0.0.1:53
udp 0 0 0.0.0.0:36005 0.0.0.0:*
udp 0 0 0.0.0.0:56663 0.0.0.0:*
udp 0 0 0.0.0.0:60949 0.0.0.0:*
udp 0 0 0.0.0.0:53 0.0.0.0:*
udp 0 0 0.0.0.0:53 0.0.0.0:*
udp 0 0 0.0.0.0:111 0.0.0.0:*
udp 0 0 192.168.1.3:123 0.0.0.0:*
udp 0 0 192.168.1.45:123 0.0.0.0:*
```

UDP - Connectionless communication

Why is it called connectionless?

- The sender does not know if and when the packet has been received
- There may be an answer, but there also may be not
- If there is an answer, the sender knows the packet got through
- If there is no answer
 - Either the packet did not get through
 - Or the answer did not get through

UDP packet processing

Security issues ahead!

- A UDP packet is received by a system
- It is delivered to the software matching the destination port number
- If a response has to be sent, it is sent back to sender
 - Using the source IP as destination of the response
 - The source-port becomes the destination port of the response
- Can you see a security problem in that?

UDP - what it is used for

NTP - Network Time Protocol

Synchronizing clocks over the Internet

- NTP is a protocol to synchronize computer clocks using the Internet
- Systems send and receive UDP packets on port 123
 - Packets contain a 32-Bit number for seconds and a 32-bit number for fractional seconds
 - Epoch (start) is 1st of January, 1900
 - Rollover will be on 7th of February, 2036
- Newest version of NTP now uses 64 bits for seconds

DNS - Domain Name Service

The phonebook of the Internet

- DNS translates names (like "www.de-cix.net") to IP addresses
- DNS is so complex and widely used, it deserves a webinar on its own
- Roughly explained
 - A system sends a name to a name server via UDP
 - The name server sends an UDP packet back containing the IP address where the name is hosted

DHCP - Dynamic Host Configuration Protocol

This is how your PC gets an IP address at home

- If you connect a computer to a network it needs an IP address
- DHCP takes care it gets one, and more
 - Your computer sends out a *DHCP request* via UDP **broadcast** to port 67
 - A DHCP server *replies* via UDP and assigns
 - an IP address
 - the default gateway
 - a nameserver (where to send DNS requests to)

UDP and network security

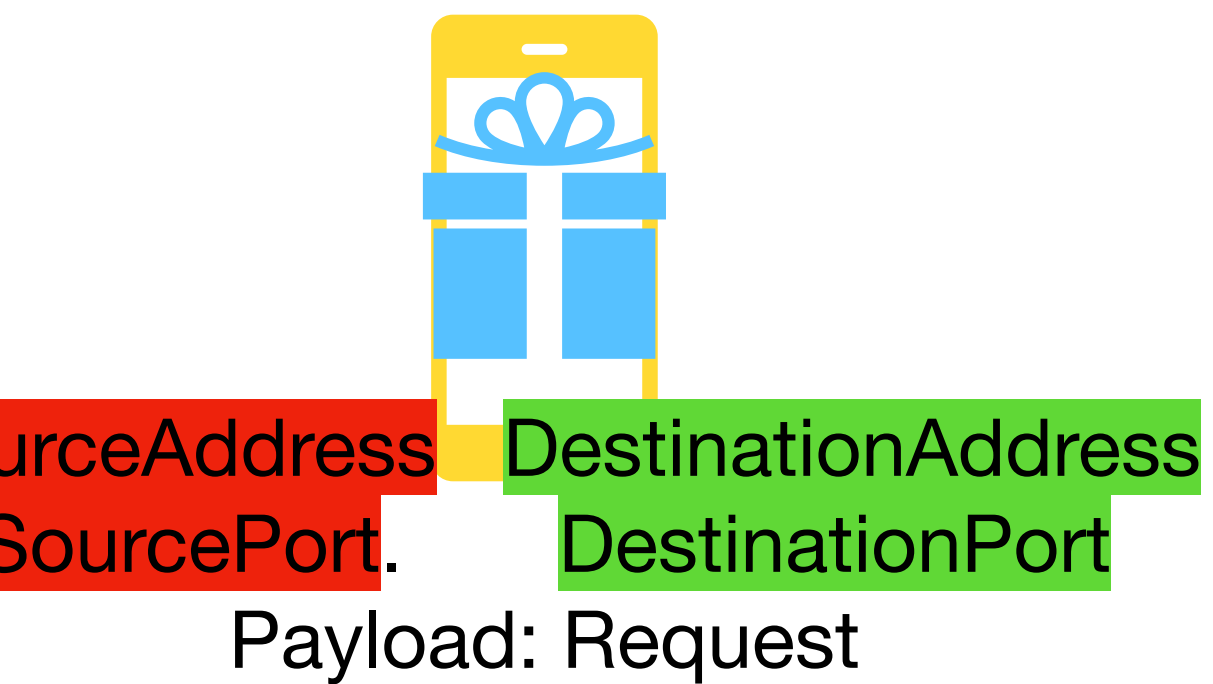

UDP normal communication

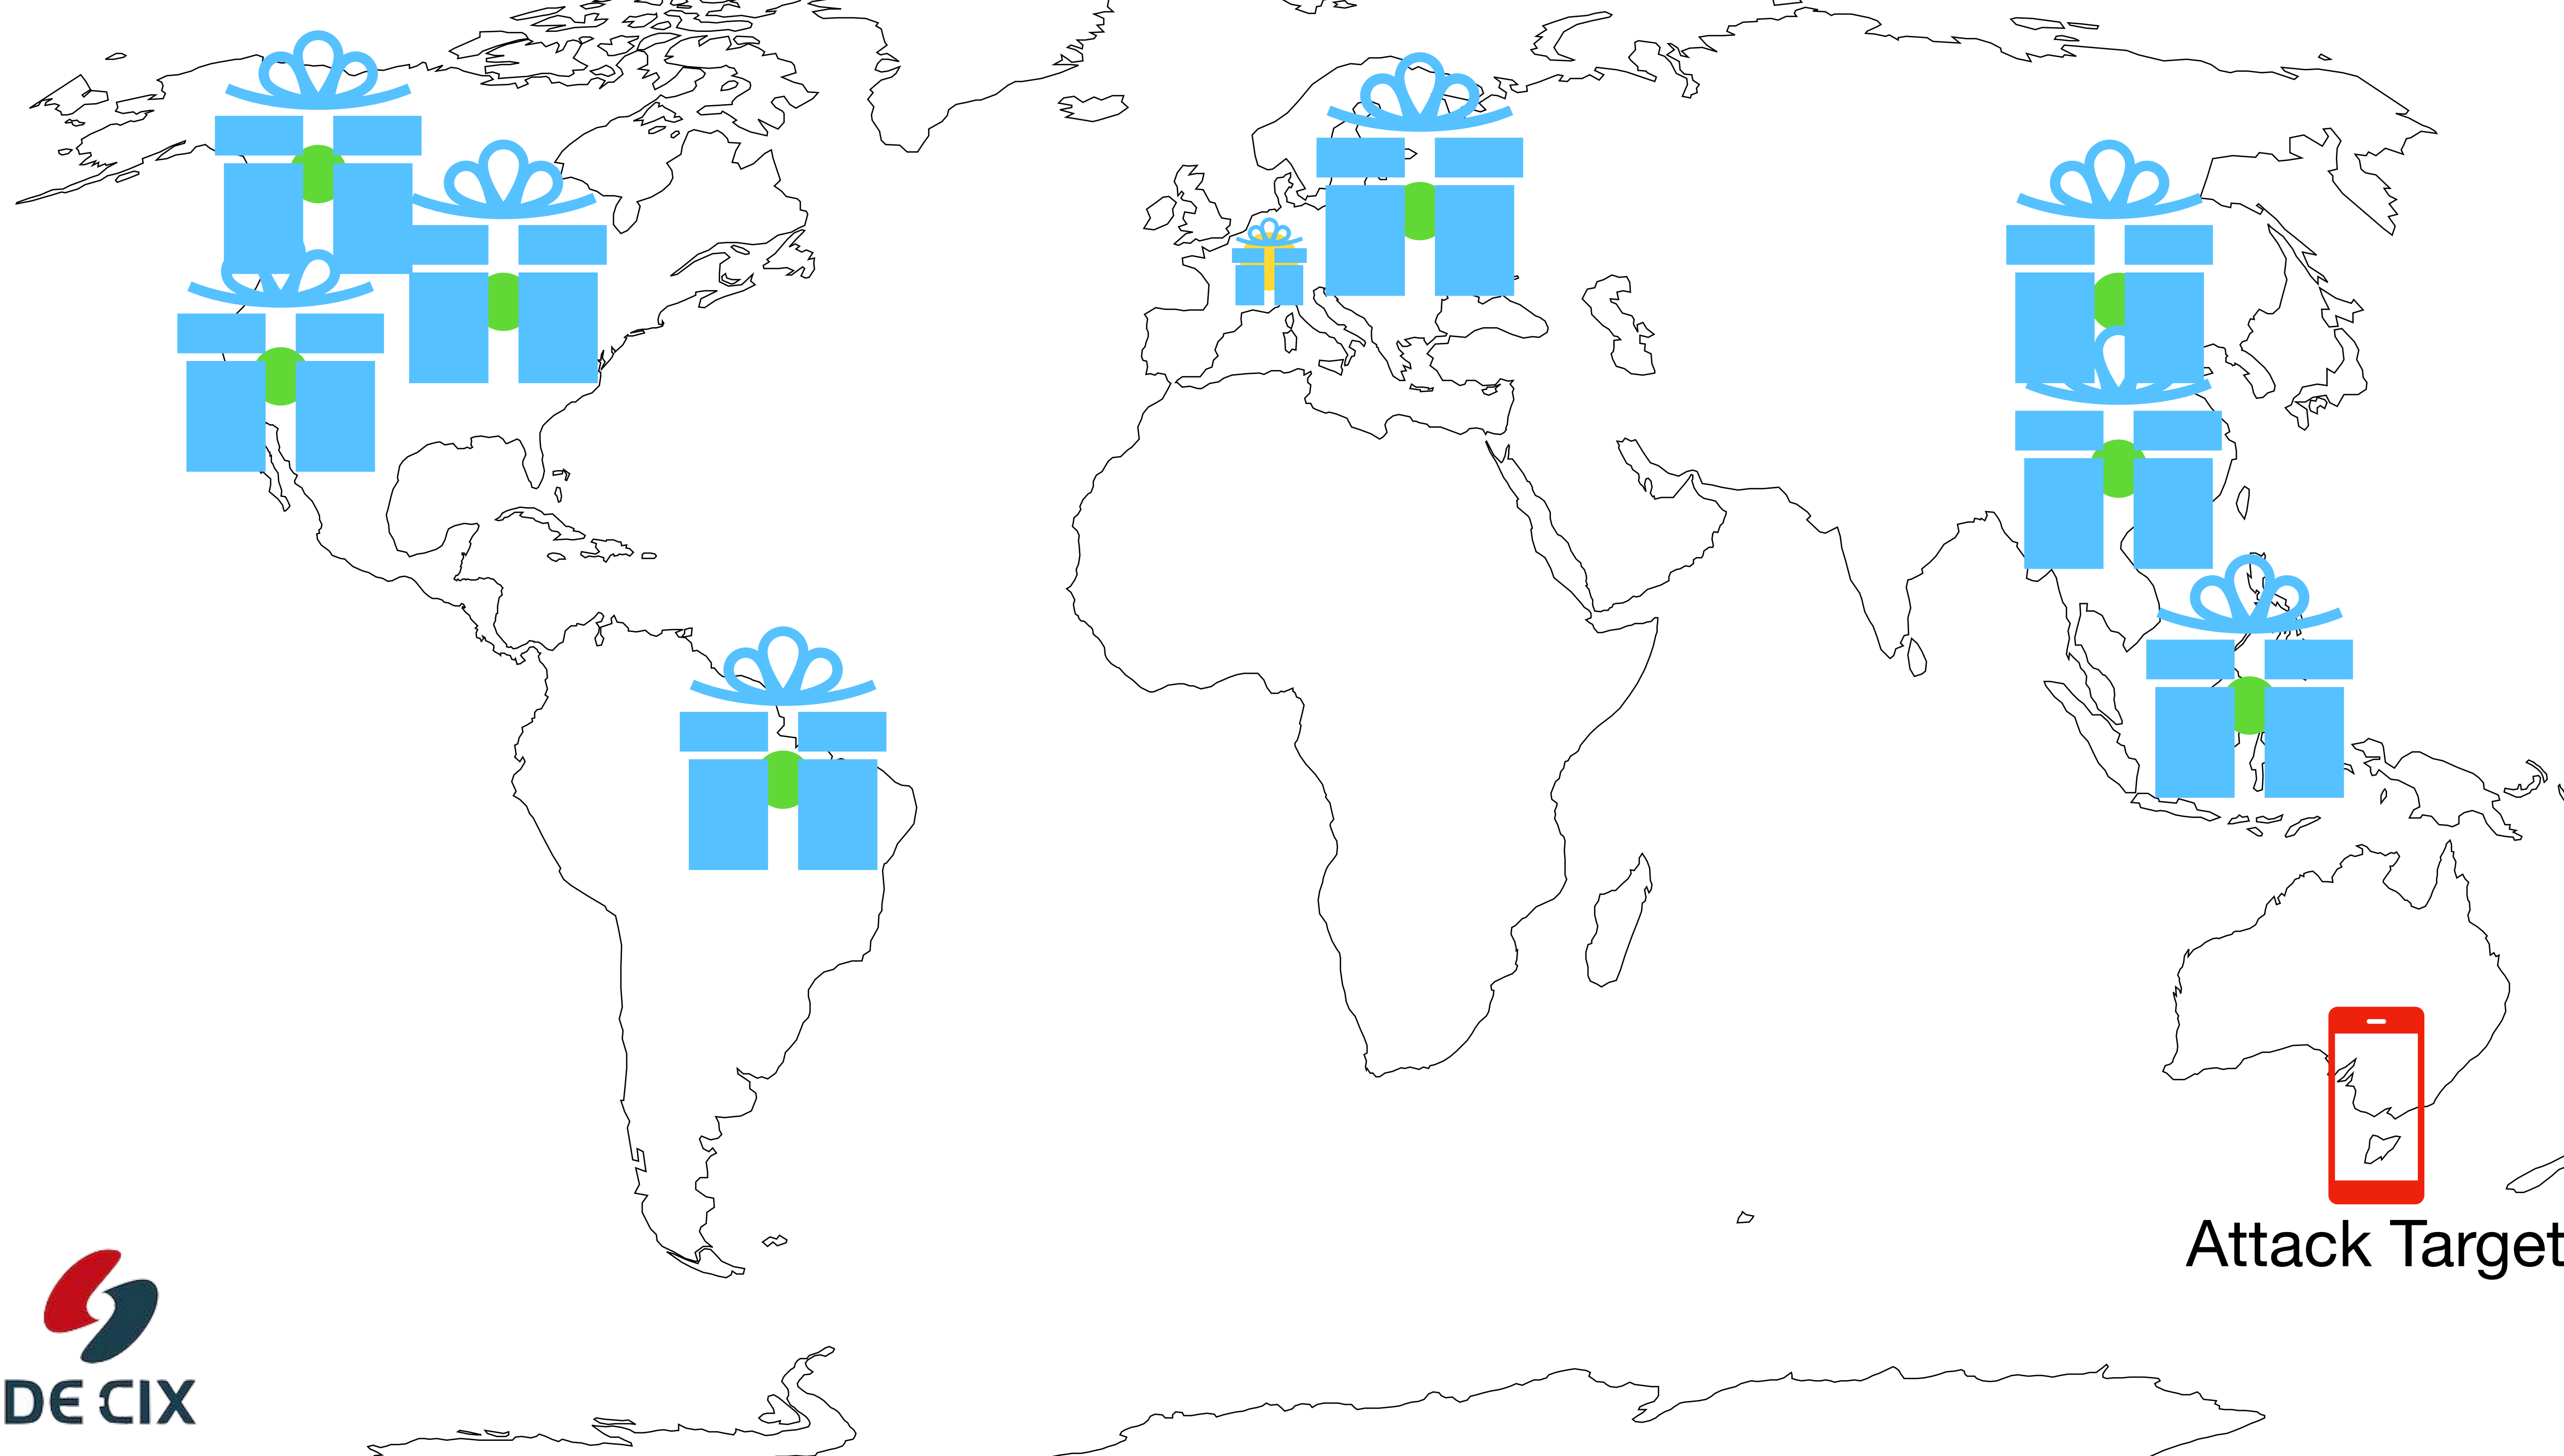

Request and answer

UDP as attack tool

Faked request and misdirected answer

Attack Target

A real world example

Memcached

- memcached is a software to cache objects in RAM for fast retrieval
- Attack method:
 - tell an unsecured installation of *memcached* to store an object
 - send an UDP packet to that installation with a **faked source IP** to retrieve that object
 - this gives you an amplification factor of up to 51000
- Solution: Remove UDP from memcached

A real world example

NTP - Network Time Protocol (2010)

- NTP is a protocol to synchronize computer clocks using the Internet
- The "*monlist*" command, sent via UDP to an NTP server returns the list of the last 600 hosts who have connected to that server
 - If sent from a faked IP source address, this list is sent via UDP to the faked source
- Solution: "*monlist*" command was removed from the software

Conclusion

Conclusion

UDP - User Datagram Protocol

- UDP is a connectionless protocol on the transport layer
- UDP packets are also called "datagrams"
 - the UDP header contains a source and a destination port number
- If misconfigured, UDP services can be used for network attacks
- More and more services which relied on UDP are moved to TCP
 - But TCP is the topic of the next episode

Layer	Name
5	Application
4	Transport
3	Internet
2	Link
1	Physical
